Hair Modeling

- Question: Why not use polygons?
 - Polygons are widely accepted
 - Artists are already familiar with polygons
- Unfortunately,
 - Polygons represent surfaces
 - Hair is volumetric
- However,
 - We perceive hair as a surface

Hair Modeling with

Hair Meshes

Hair Meshes

- Volumetric Structure
 - Topological connections
 - Can uniquely trace a path from root to tip
- Editable as a surface
 - Polygonal modeling concepts
 - Obey topological constraints

Hair Modeling with Hair Meshes

Hair Mesh Modeling

Hair Generation

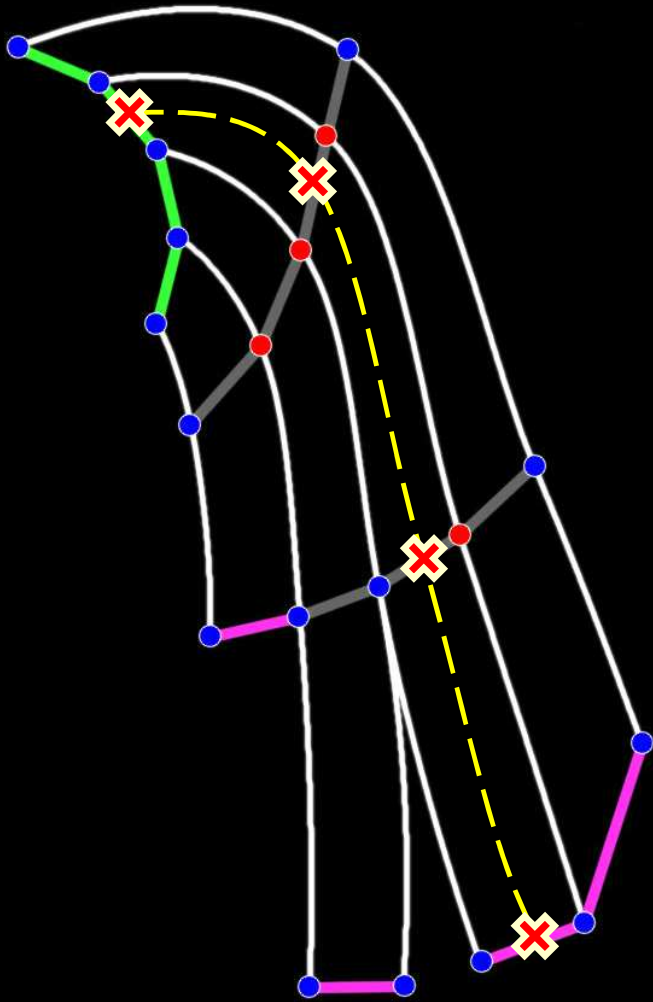

Hair Styling

Hair Meshes

- Layers
 - Root Layer
 - Tip Layer
- Vertices
 - External Vertices
 - Internal Vertices

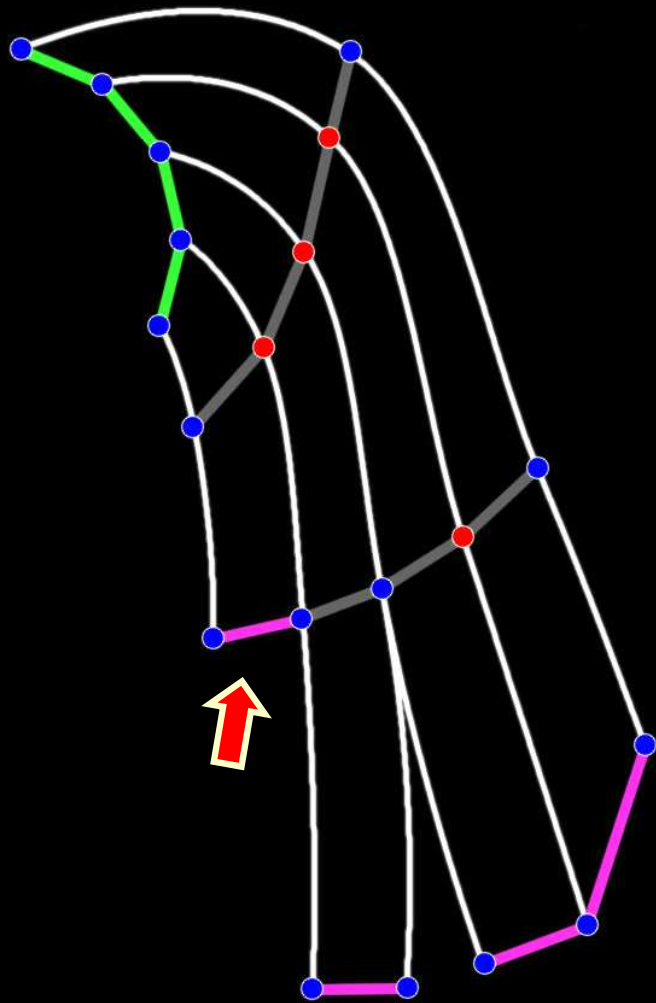

Hair Meshes

Hair Generation

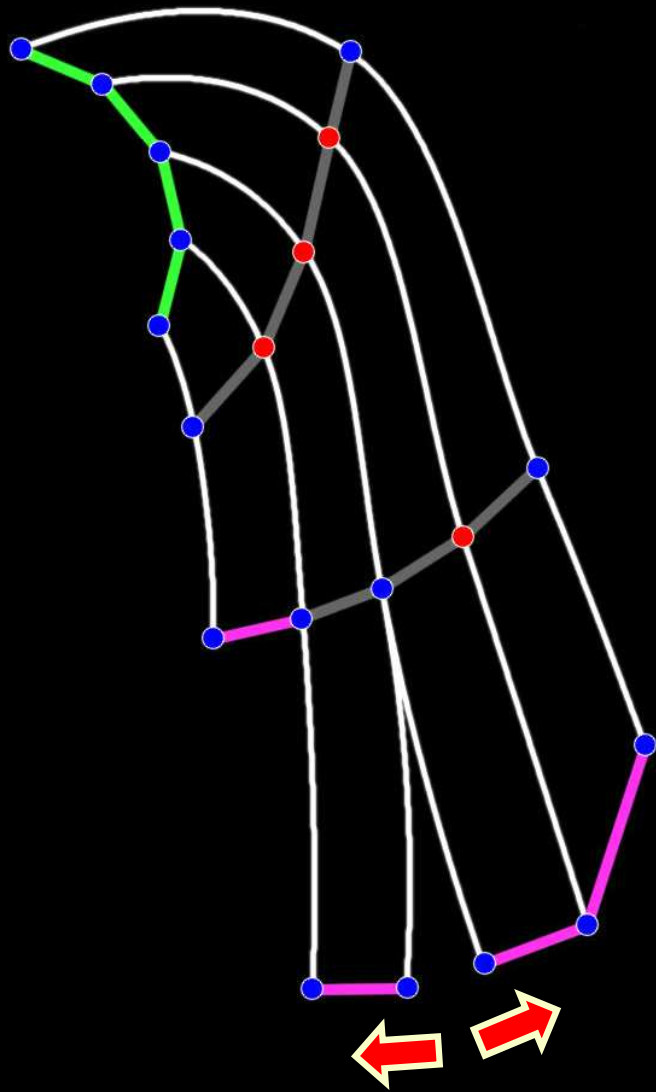

- Pick a point at root layer
- Find corresponding points on all layers
- Connect them with a curve (ex. Catmull-Rom splines)

Hair Meshes

- Tip layer can be different for each face

Hair Meshes

- Tip layer can be different for each face
- Topology can change between layers

- Face Extrude

Topological Operations

- Face Extrude

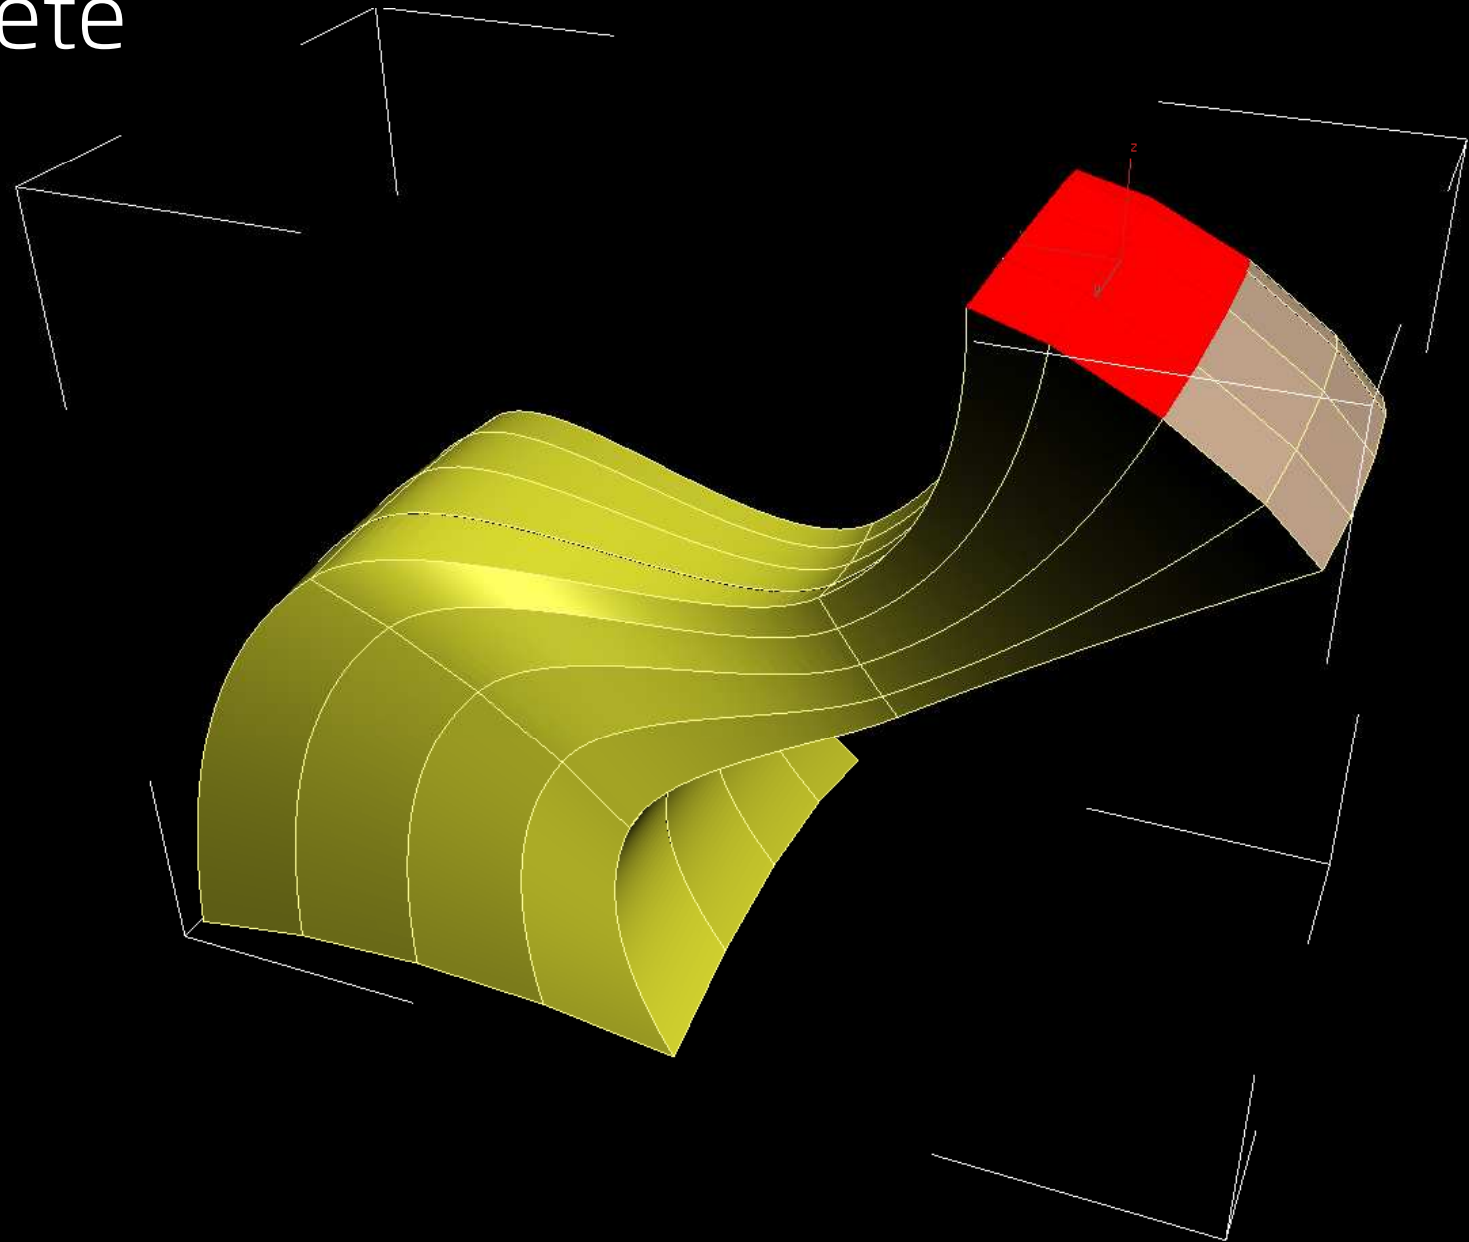

Topological Operations

- Face Delete

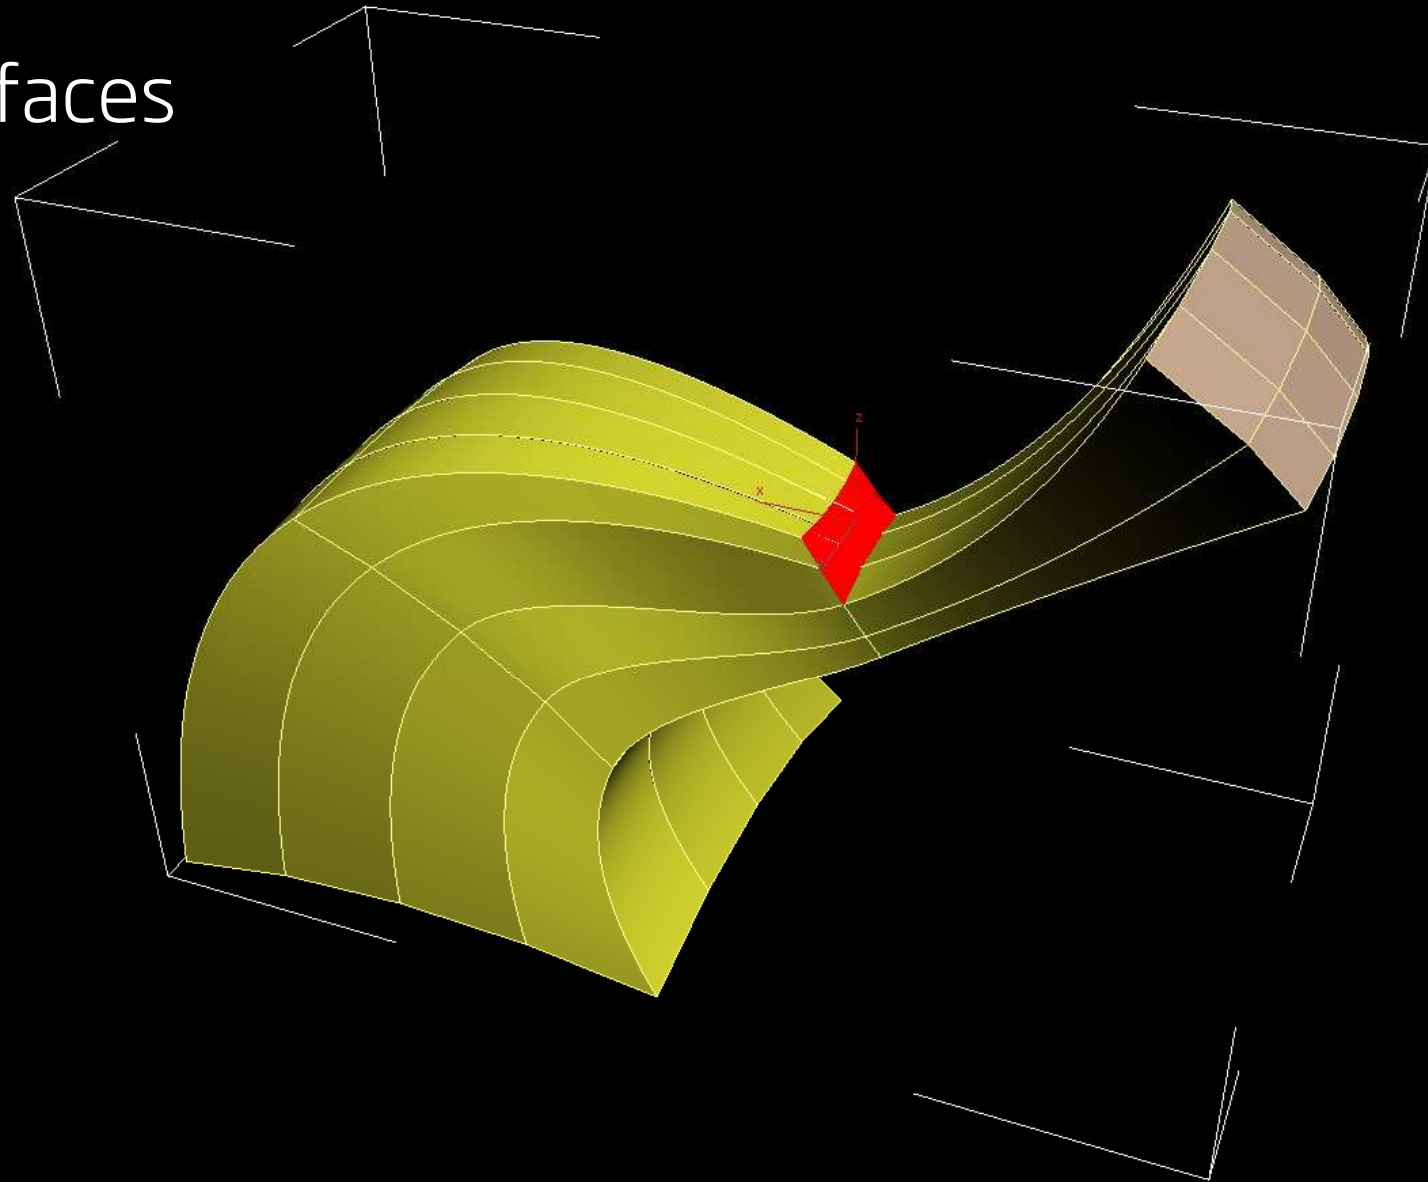

Topological Operations

- Face Delete

Topological Operations

- Face Delete
 - Only tip faces

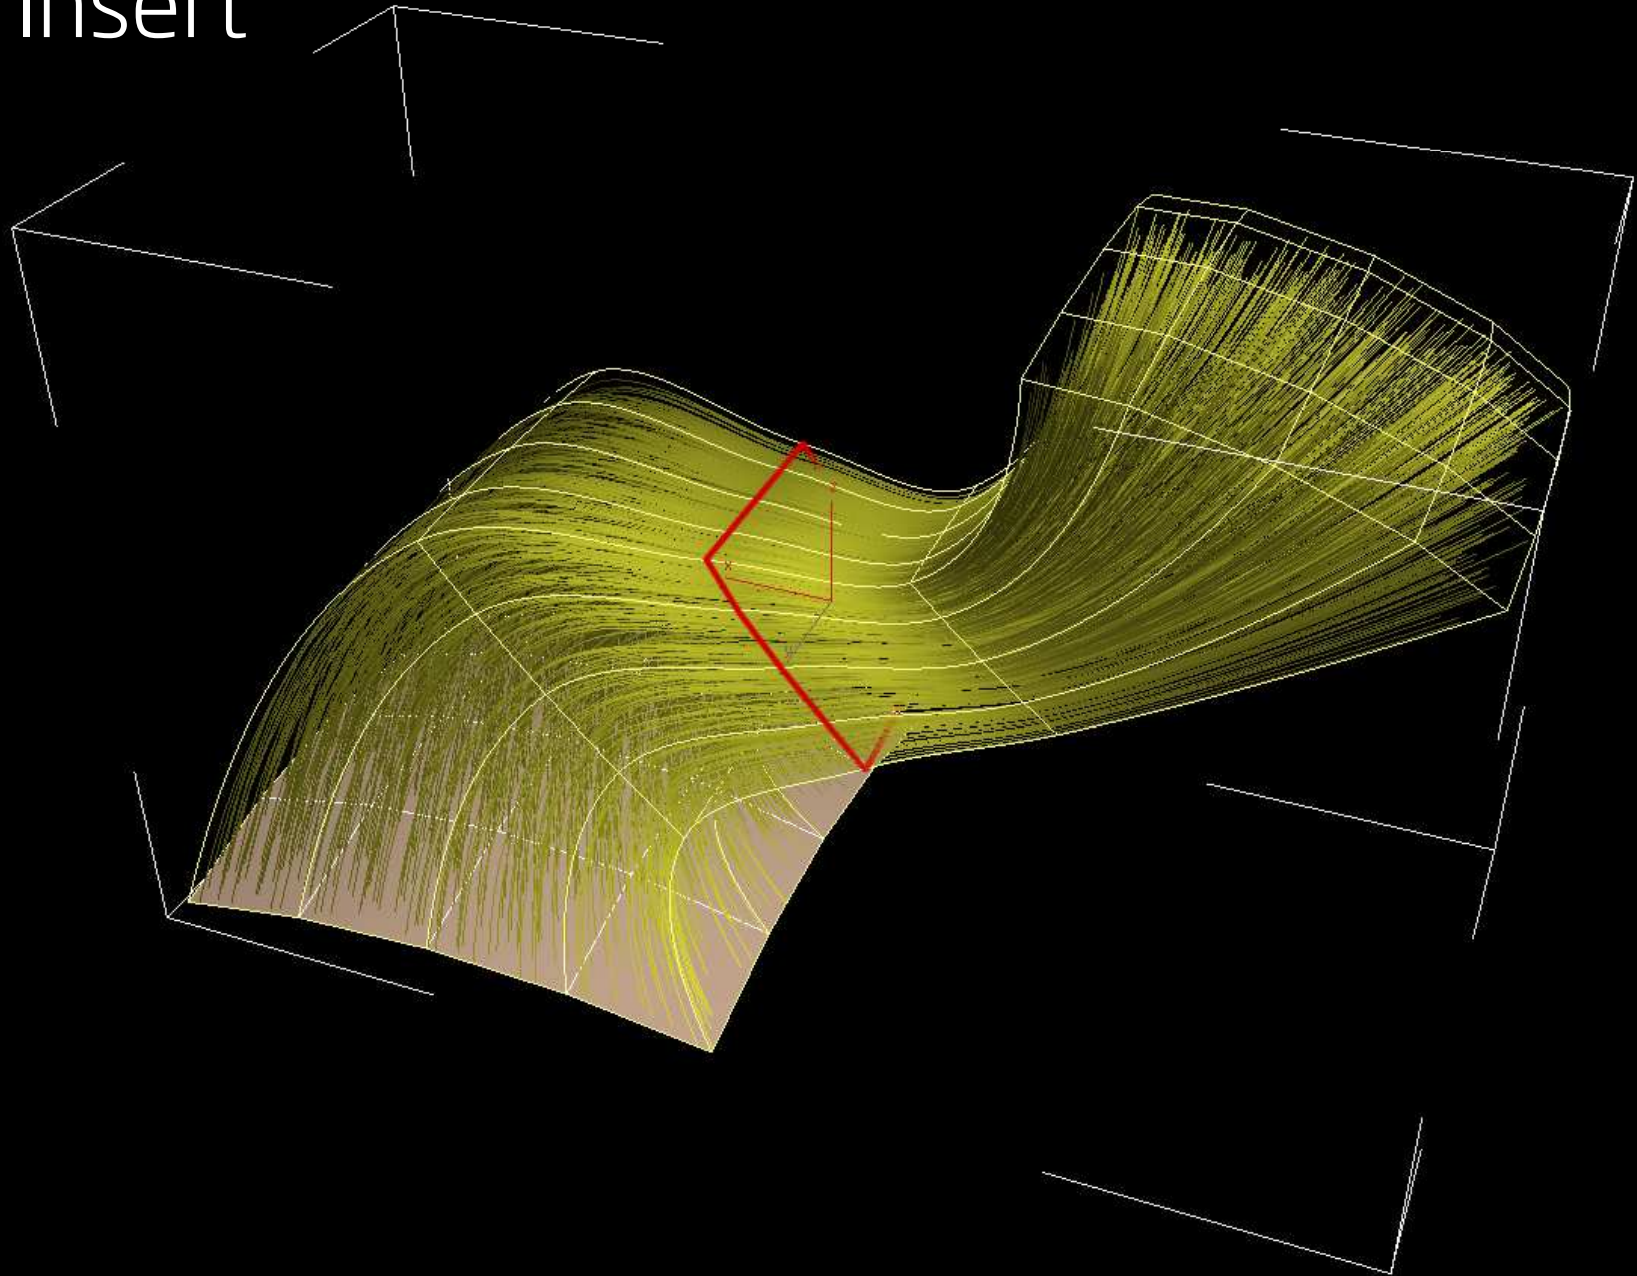

Topological Operations

- Layer Insert

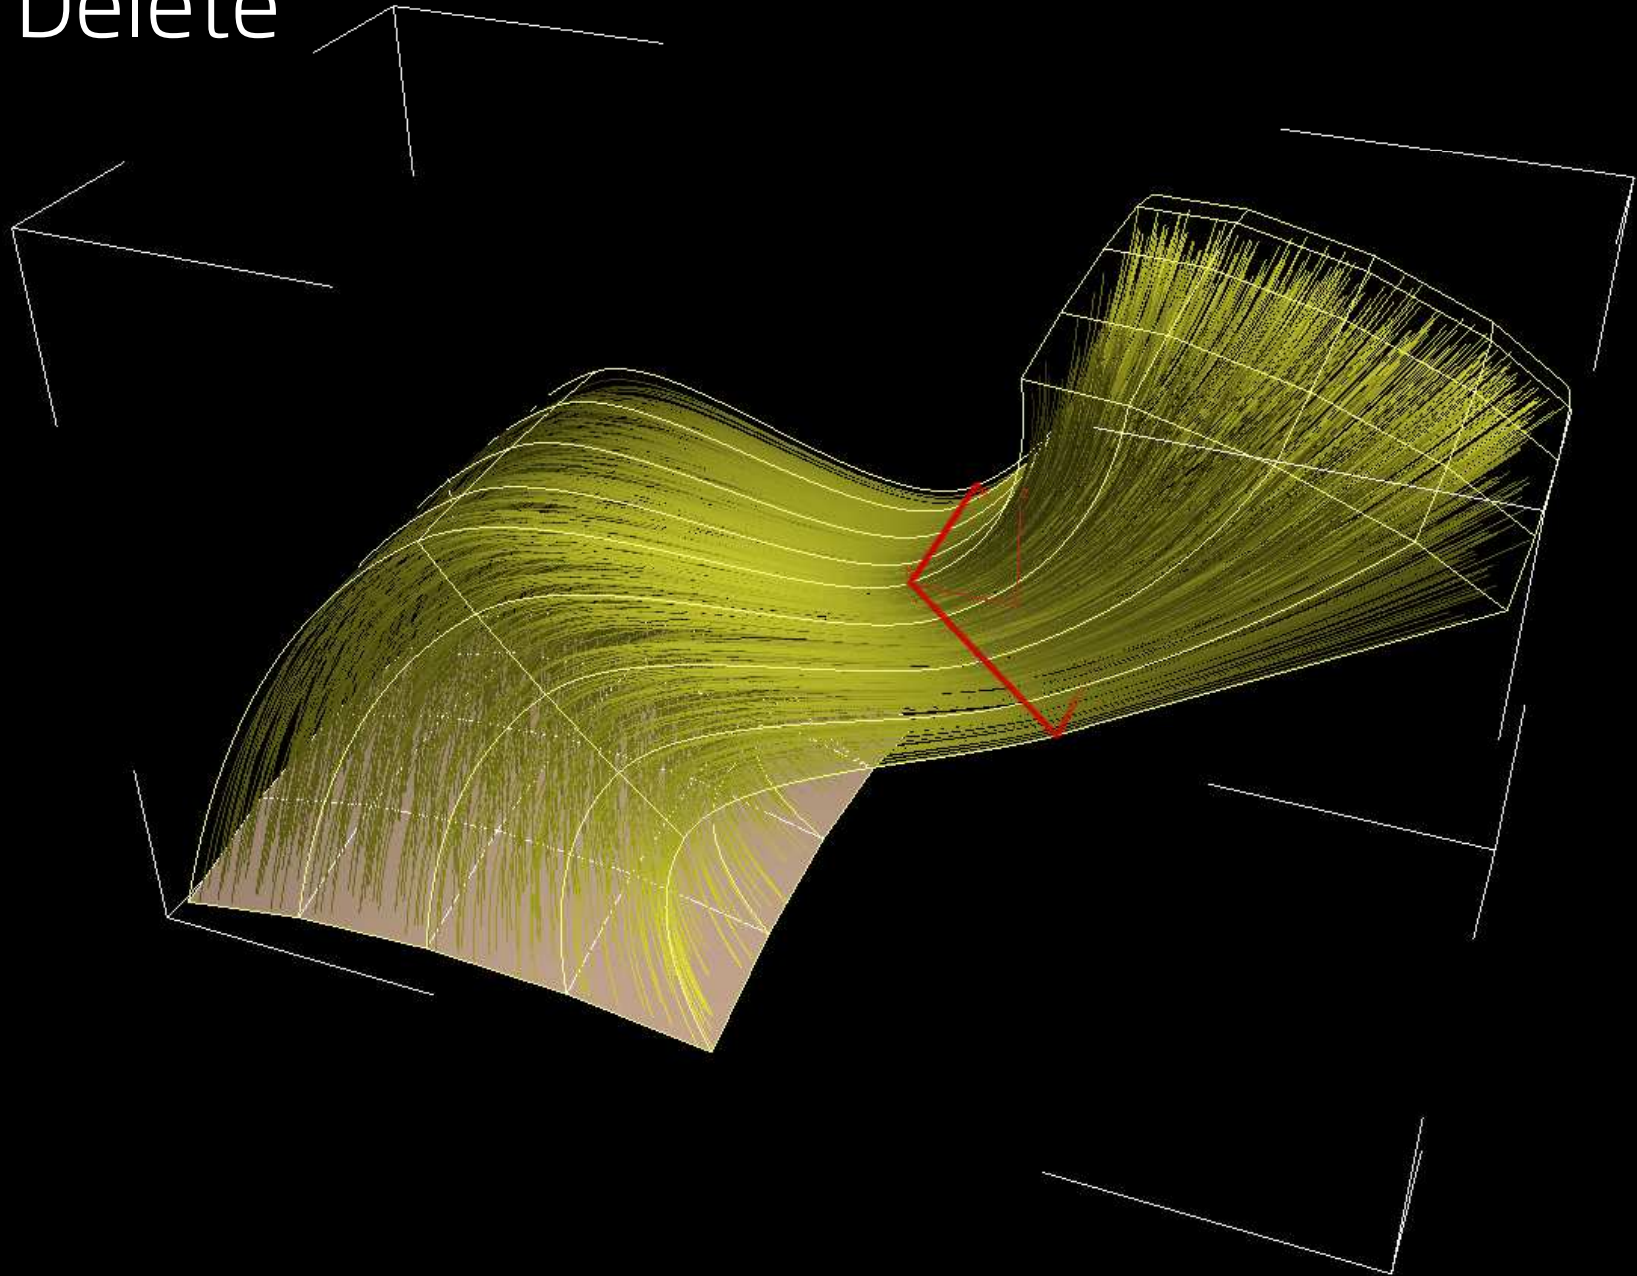

Topological Operations

- Layer Insert

Topological Operations

- Layer Delete

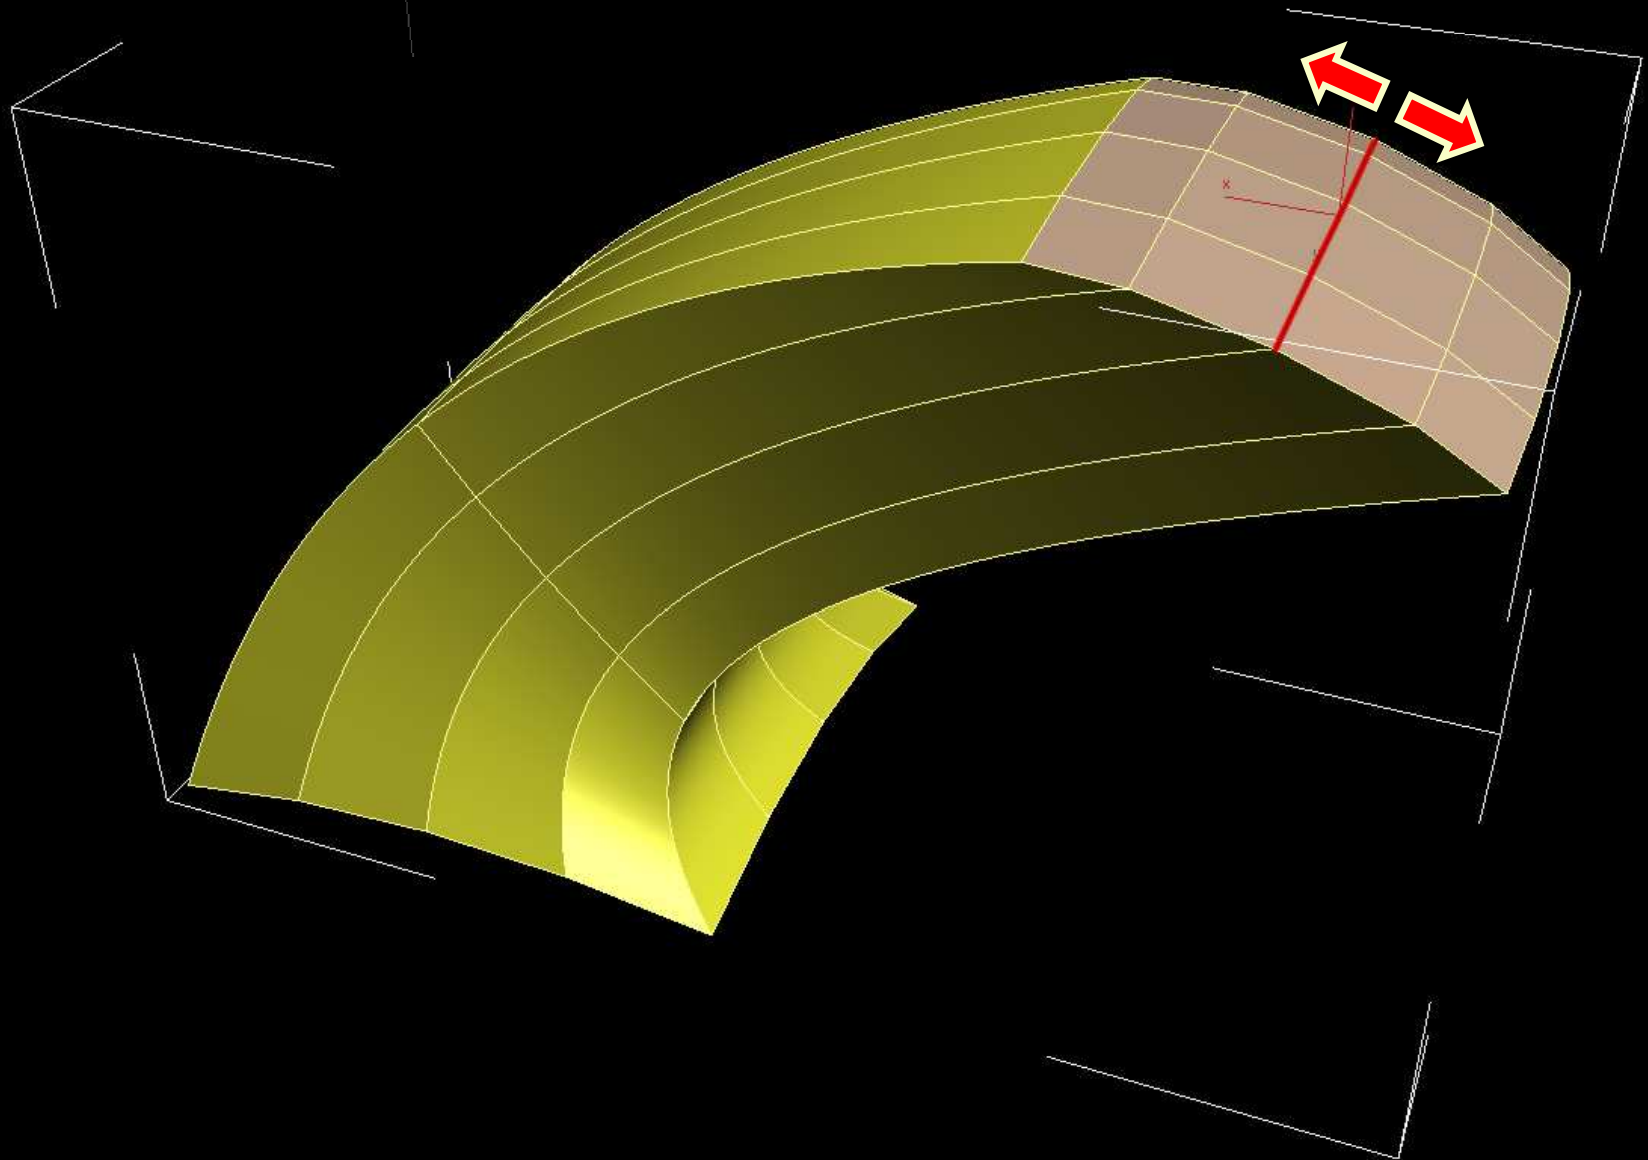

Topological Operations

- Layer Delete

Topological Operations

- Edge/Vertex Separate

Topological Operations

- Edge/Vertex Separate

Topological Operations

- Edge/Vertex Weld

Topological Operations

- Edge/Vertex Weld

Topological Operations

- Edge/Face Divide and Subdivision

Topological Operations

- Edge/Face Divide and Subdivision

Topological Operations

- Edge/Face Divide and Subdivision

Hair Mesh

Geometrical Operations

Geometrical Operations

- User interacts with the external surface
- Internal structure is automatically shaped

- External Vertices
- Internal Vertices

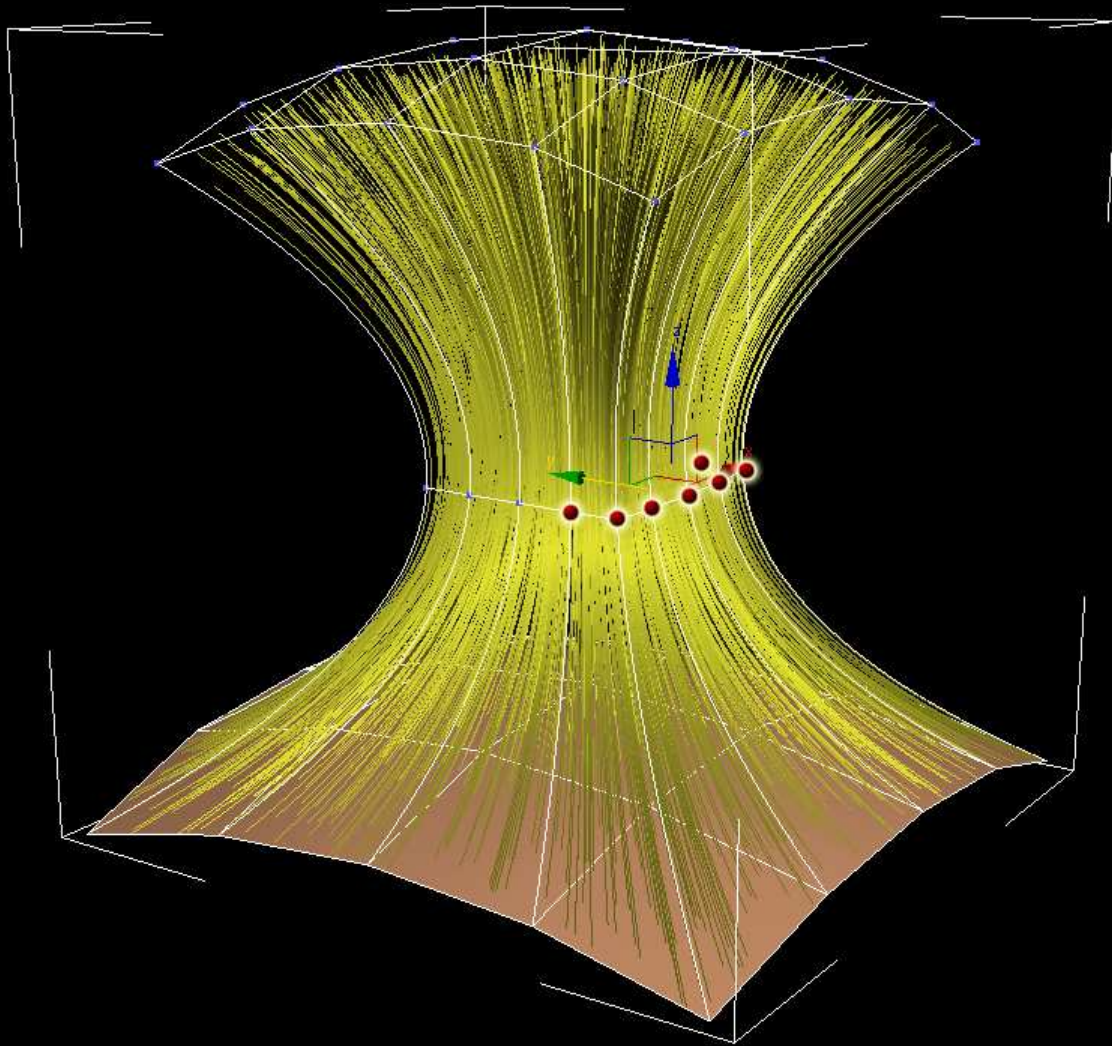

Geometrical Operations

- Internal Vertex Placement
 - Part of the modeling process
 - It has to be fast
 - Constrained quadric minimization
 - Operates on the whole hair mesh
 - External vertices are fixed
 - Error is the difference between tangent edges
 - Favor local uniformity
 - Initial conditions are the previous positions
 - Solved using Conjugate Gradients
 - Converges after a few iterations

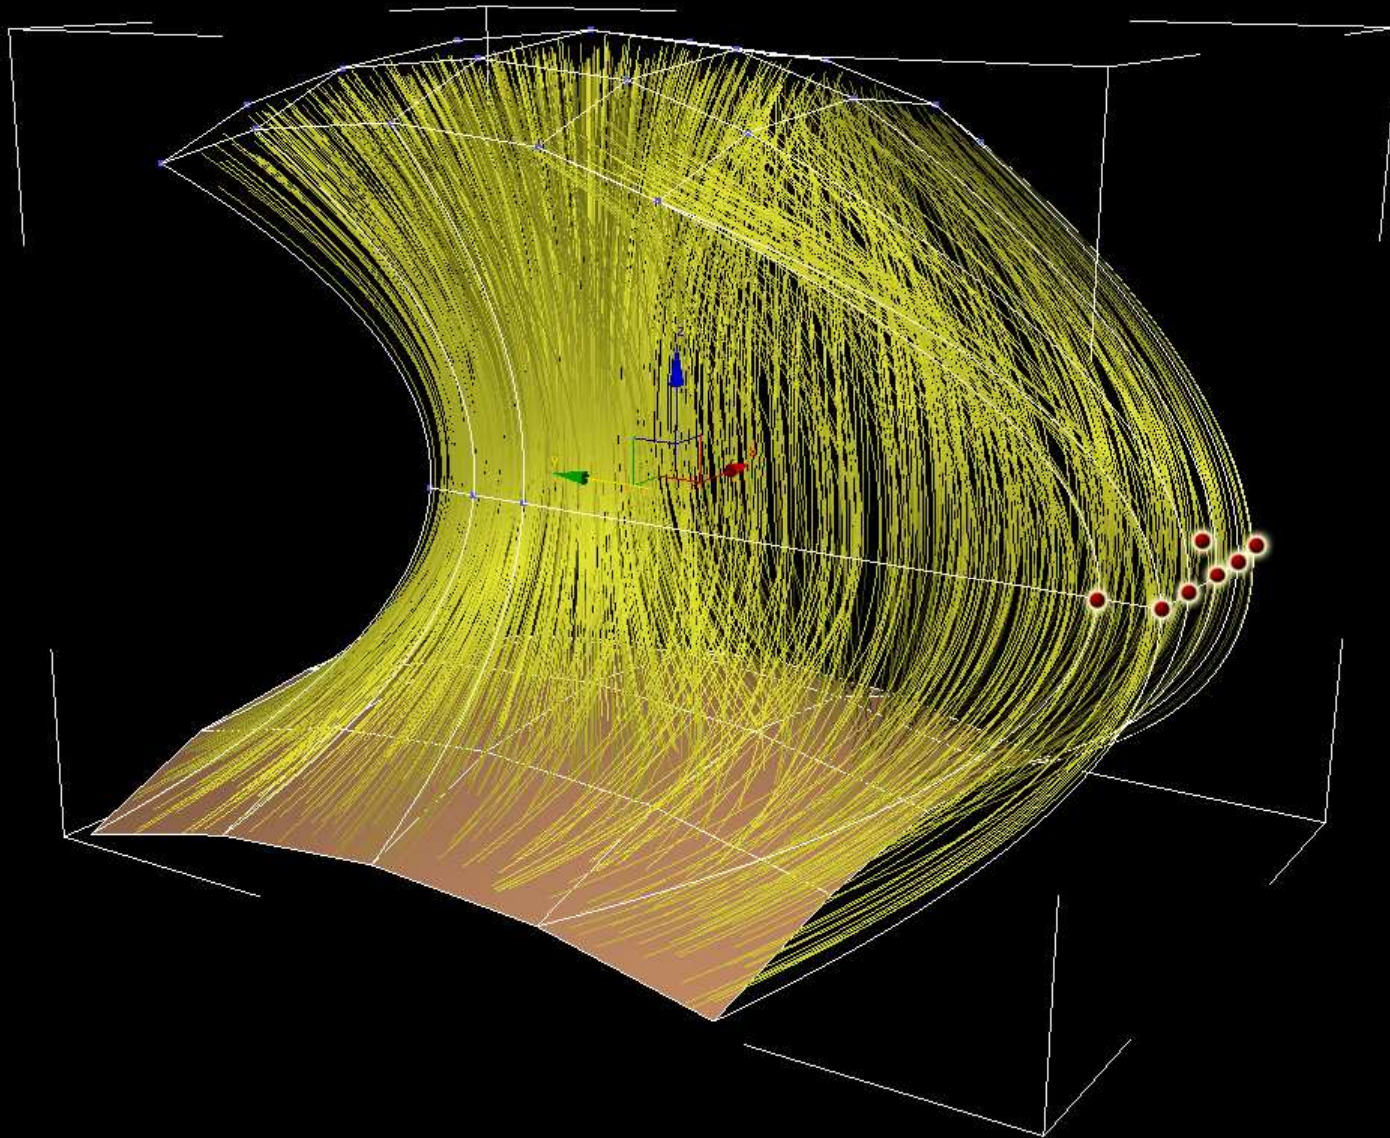

Geometrical Operations

- User SELECTs vertices to move

Geometrical Operations

- User MOVES selected vertices

Geometrical Operations

- Internal vertices are automatically placed

Geometrical Operations

- Internal vertices are automatically placed

Hair Generation

Hair Styling

Hair Styling

- All operations on hair strands are *styling* operations

Hair Styling

- All operations on hair strands are *styling* operations
- Procedural Styling

Hair Styling

- All operations on hair strands are *styling* operations
- Procedural Styling
- Combining with wisp-based methods

Hair Meshes

Results

Wrapping Up...

- Hair Meshes
 - Polygon-like modeling
 - Intuitive
 - Direct Control

Thanks!

 - Lee Perry-Smith
 - Alexander Tomchuk
 - Cedric Lepiller
 - Marc Mordelet
 - Luc Begin
 - Anish Mohan
 - Rune Spaans
 - Nildo Hassane Essa

Cyber Radiance™ proudly presents
HAIRFARM™
THE ULTIMATE HAIR PLUG-IN FOR 3DS MAX
Precise modeling
Fast rendering
Réalistic materials
Controllable Animation
